Abstract

A fully functional telephone set, which may be a standard cord phone, cordless, or wireless (cellular) is equipped with an emergency condition sensor, such as a motion sensor for intrusion detection, and a smoke or fire detection sensor. A single push button arms or disarms the system, with a short time delay. If an emergency condition is detected, the phone dials out to the last number dialed or to some number preset by the user. In the case of fire detection or intrusion detection, an alarm in the telephone instrument is sounded. A silencer switch permits a silent alarm mode for intrusion detection. A sensitive microphone permits monitoring of the protected area from the called station.
